Stable premiums, supported by new consolidations¹

- § Group GWP show steady development
- § Austria: In Life, inclusion of s Versicherung offsets ongoing weak single premiums; current premiums flat in Q3; in P&C, weak motor market is driven by sale of smaller cars (V.I.G. still growing above market), expected recovery of pricing not seen in Q3; sound non-motor growth
- § Czech Republic: Increase in Non-life despite very weak motor market; substantial growth in Life both organic or including consolidation of s Versicherung
- § Slovakia: In Non-life growth achieved against shrinking market and despite strict pricing strategy of V.I.G.; Life supported by consolidation of s Versicherung
- § Poland: Non-life influenced by focus on product profitability; Life driven by weak single premium business
- § Romania: Ongoing portfolio restructuring in Non-Life (sharp increase of tariffs by V.I.G. as market leader) leading to interim loss of market share; Life up due to consolidation of BCR which is growing tremendously against market
- § Other CEE: Non-life influenced by consolidation effects. Life still growing vs. weaker motor markets
- § Other Markets: Continuous growth in Non-life and Life in Germany, while single premium business is down in Liechtenstein

¹: Note: For changes in scope of consolidation see previous page

1: In Croatia, a one-off provision of about EUR 10 million had to be recognised in the financial statements due to a regulatory reduction of the guaranteed interest on life insurance contracts. This had an adverse effect on the result.

The total return on the GEV is mainly driven by an exceptional financial markets dislocation – a combination of low interest rates, negative equity returns, higher spreads on fixed income securities and high interest rate and equity volatility. A stable operating performance partly offsets these negative impacts and even leads to a positive return in CEE.

Change in Methodology and Assumptions

- § Allowance for Cost for Residual Non-Hedgeable Risk
- § The reference interest rates used for the EEV calculations are based on the corresponding swap rates at December 31, 2008 and include a liquidity spread of 50 bp for all terms
- § Volatilities used to calibrate the economic scenario generator at December 31, 2008 are based on average volatilities over 2008
- § All results shown after minorities and tax
- § GEV allows for all consolidation effects

Comments

- § The NBV represents the value generated by new business sold during the reporting period.
- § The NBV in A/G has decreased due to lower margins on the participating life insurance business as a result of the lower interest rates and higher volatility.
- § The total new business volumes in A/G have not changed relative to the previous year.
- § The total new business volumes in CEE as measured by PVNBP have increased.
- § The NBV in CEE has increased due to higher new business margins.

The increase of NBV in CEE more than offsets the reduction in A/G and leads to an increase of NBV for the Group.
